Swingplane Ventures, Inc. Option Payment Made

Swingplane Ventures, Inc. Option Payment Made

SANTIAGO, CHILE -- (Marketwire) -- 02/06/13 -- Swingplane Ventures, Inc. (OTCBB: SWVI) (the "Company" or "Swingplane") is pleased to update information pertaining to the Algarrobo property.

The Company's Algarrobo Property (the "Property") is an Iron Oxide - Copper - Gold (IOCG) property located approximately 850 km north of Santiago, in the III Region, Province of Copiopo, Chile. The city of Copiopo is located approximately 43 km to the southeast of the Property, with the small port city of Caldera 25 km to the east. The Property consists of 32 tenures, comprising a total of 6,161 ha (15,224 acres).

Swingplane is pleased to report that the all of the initial payments in the total amount of \$1,200,000 have been made as required under the assigned option agreement and amendments (the "Option") with Swingplane making the last payment of \$125,000 to bring the Option into full compliance. Swingplane and Mid Americas Corp. have completed payments of \$1,200,000 with Swingplane making the last two payments, totaling \$250,000. The next payment of \$750,000 is due on or before June 30, 2013. Swingplane is finalizing its Share Exchange Agreement whereby it will have direct rights to the Option by way of the acquisition of Mid Americas Corp. and expects to finalize that acquisition on or before February 15, 2013.

In addition, the Company is completing construction of a camp on the Property capable of accommodating 30 people. The camp has been built in the immediate vicinity of current, active drift development, with accommodation for the underground crew, field personnel and management. The camp will be utilized to support exploration of the Property, together with current and future development activity on the Property.

Completion of the camp is timely with respect to anticipated receipt of the license required to sell stockpiled material to ENAMI in Copiapo and a concurrent increase in development for the purposes of initial, limited production from the existing drifts. The camp is well situated to support current operations and further, planned development in the near future.

Swingplane Reports results from sale of initial test shipments of Low Grade
Mineralized Material from Algarrobo Property

PR Newswire

SANTIAGO, Chile, Feb. 13, 2013

SANTIAGO, Chile, Feb. 13, 2013 /PRNewswire/ -- Swingplane Ventures, Inc.
(OTC-BB: SWVI) (the "Company" or "Swingplane") is pleased to update
information pertaining to the Algarrobo property.

The Algarrobo Iron oxide-Copper-Gold (IOCG) property (the "Property") is
located approximately 850 km north of Santiago, in the III Region, Province of
Copiapo, Chile. The city of Copiapo is located approximately 43 km to the
southeast of the Property, with the small port city of Caldera 25 km to the
east. The Property consists of 32 tenures, comprising a total of 6,161 ha
(15,224 acres).

Multiple shipments of low grade, copper mineralized vein material ("Mineral
Cobre Lixiviacion", or Cu mineral for leaching) have been delivered to the
ENAMI facility over the two months. The ENAMI facility at Copiapo (45 km
south of the Property) is a government owned smelter and processing facility,
primarily for copper ore. The material shipped to date is low grade, copper
mineral for leaching, having documented grades, as determined and reported by
ENAMI, ranging between 1.88% and 8.8%.

These initial, test shipments comprise a reported total of approximately 500
tonnes of low grade, copper mineralized vein material produced, and
stockpiled, from three of the drifts developed over the past year. The low
grade material represents hand sorted material produced from mineralized
haloes around high grade, copper mineralized veins exposed along the "Veta
Gruesa Centre", "Exploration" and "Descubridora I" drifts. These shipments
have been made to evaluate the expenditures and financial return associated
with processing and shipping low grade mineralized material produced during
development along high grade, copper mineralized veins.

Certificates received by the Company to date document delivery of
approximately 94 tonnes from the Veta Gruesa Centre (7 shipments grading
between 1.88 and 2.64% Cu), 58 tonnes from the Exploration Drift (3 shipments
grading between 3.24 and 4.28% Cu) and 36 tonnes from the Descubridora Drift
(three shipments grading between 7.75 and 8.8% Cu). (Note: the Veta Gruesa
and Production drifts have both been developed on the Veta Gruesa, which
extends farther east to the Veta Gruesa East Drift - see News Release dated
January 30, 2013). The material shipped from the Descubridora Drift returned
much higher copper grades than anticipated and, therefore, subsequent
shipments of similar material will be delivered as "Direct Shipping" ore.

Total value received to date for the shipments totals approximately \$30,845,
however, this total does not include payment for 5 of the shipments,
comprising approximately 58 tonnes of mineralized material. Two of the
shipments comprise higher grade material from the Exploration Drift (grading
between 4.06 and 4.24% Cu) and all three "high grade" shipments from the
Descubridora Drift (grading between 7.75 and 8.8% Cu). All five shipments,
particularly those from the Descubridora Drift, are expected to provide a
higher rate of return due to the higher grade material delivered. As a result

2013-02-13 PRN SWVI Reports Results From Initial Sale of of these high grades, all of the ore stockpiled from the Descubridora Drift will be shipped in the future as "Direct Shipping" ore.

In addition, a single delivery of "Direct Shipping" ore was made on January 21, 2013, for which the corresponding ENAMI certificate documents a grade of 11.42% copper. Payment for this shipment has not yet been made, and is expected within the next two weeks. The remainder of the hand sorted, "Direct Shipping" ore, comprising approximately 400 to 500 tonnes, from the Veta Gruesa Centre, False Estaca and Descubridora remains stockpiled on-site. It has been hand-sorted and is estimated to have an average grade between 10 and 12% Cu. Furthermore, initial material from the Descubridora Drifts has returned very high grade material, to 46.58%. Shipment of "Direct Shipping" ore will commence once the required ENAMI license has been received, expected within the month. Sale of high grade mineralized material to ENAMI requires a license, following a thorough review of the application for license and a review of the property and workings for which the license is being sought.

Work on behalf of the Company, since February, 2012, has emphasized identification of high grade, copper mineralized veins for subsequent development into drifts. To date, a total of five drifts have been developed on the Property. Three of the drifts, the "Veta Gruesa Centre", "Exploration" and "Veta Gruesa East" drifts, have been developed along the Veta Gruesa, separated by a minimum of 150 m. The remaining two, False Estaca and Descubridora, are developed along interpreted extensions of Major Veins. More recent work exposed a second drift on the Descubridora Vein, approximately 40 m farther west and at slightly lower elevation. This second drift was developed to further exploit very high grade copper ore (up to 50% Cu) exposed in the initial Descubridora Drift.

An additional 11 high grade copper mineralized veins have been exposed, with a minimum of 8 additional sites proposed, for subsequent development into drifts. With receipt of the ENAMI license pending, the Company intends to change its emphasis to further underground development of the existing drifts for the purposes of production.

The Company has not undertaken any preliminary feasibility study or preliminary economic assessment with respect to the Property and does not intend to undertake such a study or assessment prior to making a production decision. There are significant risks associated with making a production decision without a valid, current, economic analysis and the Company may subsequently determine that production from the Property is not economically feasible.

Swingplane Ventures, Inc. Displays Economic Iron Content Consistent with Chilean Iron Belt

Swingplane Ventures, Inc. Displays Economic Iron Content Consistent with Chilean Iron Belt

SANTIAGO, CHILE -- (Marketwire) -- 02/14/13 -- Swingplane Ventures, Inc. (OTCBB: SWVI) (the "Company" or "Swingplane") is pleased to update information pertaining to the Algarrobo property.

Swingplane Venture, Inc.'s (the "Company") Algarrobo Property (the "Property") is an Iron Oxide-Copper-Gold (IOCG) property located approximately 850 km north of Santiago, in the III Region, Province of Copiapo, Chile. The city of Copiapo is located approximately 43 km to the southeast of the Property, with the small port city of Caldera 25 km to the east. The Property consists of 32 tenures, comprising a total of 6,161 ha (15,224 acres).

Iron Oxide-Copper-Gold (IOCG) deposits are characterized by high iron content, as magnetite and/or hematite, with variable amounts of copper and other by-product metals and/or minerals. Deposits having high iron content with little or no copper ("Kiruna-type"), as well as typical IOCG deposits occur along the length of the Chilean Iron Belt. The closest example of an iron-rich deposit (having subordinate copper) to the Property is Cerro Negro North (approximately 20 km to the east). The deposits of the Punte del Cobre -- Candelaria (approximately 65 km south) and both Mantoverde (AngloAmerican) and Santo Domingo (Capstone Mining), both of which are approximately 30 km north, are the closest examples of IOCG deposits to the Property.

The Property shows similar vein-style IOCG mineralization to that reported from the above examples. Veins having a high hematite content (as "almagradito", an intimate mix of copper minerals and hematite) up to 5 m thick are relatively abundant throughout the Main Mineralized trend and, more specifically, the Major Veins (see News Release dated January 30, 2013). Analytical results from samples taken during two Due Diligence Property visits (in February and December, 2013) confirm high iron content (to 55.24%), together with copper grades ranging between 1.06 and 46.58% (representative grab samples from high grade veins and/or high grade mineralized material hand sorted for sale to ENAMI. Note: Grab samples are selective by nature and are unlikely to represent average grades of the deposit).

R. Walker, Q.P. for the Company, undertook an initial Due Diligence property evaluation between January 30 and February 2, 2012. Two and a half days were spent undertaking a preliminary evaluation of the Property. Property orientation emphasized a review of existing workings and historical underground mines exposed at surface on, and immediately adjacent to, the Property. The majority of the workings defining the three "Major Veins" and the "Main Mineralized Trend" are located within, and immediately adjacent to, the northeast and eastern portion of the Property (i.e. the portion of the Property defined by the Roble tenures).

A total of 22 representative samples were recovered during the visit, from copper-bearing veins from four separate areas on the Property. Select sample results are tabulated below.

Note: Grab samples are selective by nature and are unlikely to represent average grades of the deposit.

The primary objective of the property evaluation was to evaluate the mineral potential of the Property based on the continuity and apparent strike extent of the three Major Veins described in the area, as well as evidence for a series of secondary, subsidiary and/or en echelon, high grade, copper mineralized veins. The primary evidence available to define individual veins are the surface workings excavated to develop them, primarily in the form of limited surface to near sub-surface excavations.

On the basis of this initial property visit, the following conclusions were made:

1. Several samples document anomalous levels of silver and gold, which, together highly anomalous cobalt (> 4,000 ppm), Lanthanum (> 2,000 ppm) and Cerium (> 2,000 ppm), are consistent with the Iron Oxide-Copper-Gold (IOCG) mineral deposit model;

2. The majority of the samples confirm highly anomalous to potentially ore grade copper (by definition, as rock grading in excess of 9% Cu can be shipped to the ENAMI facility at Copiapo as "Direct Shipping Ore");

3. Samples recovered from exploratory trenches, located approximately 6.3 km from the nearest producing veins, are interpreted to indicate potential for identification of additional, well mineralized, copper-bearing veins below the extensive eolian sand cover characterizing the Angela tenures;

4. There is sufficient evidence to support the interpretation that existing production on the Property can be increased, both in terms of continued underground development on existing drifts through the purchase of heavy equipment as well as development of additional production drifts on other high grade, copper mineralized veins identified on the Property;

5. There is evidence that the currently identified "Major Veins" and/or the subsidiary veins identified on and/or adjacent to the Property potentially extend farther in both directions along strike and to greater depth than currently tested in the majority of workings to date;

6. Subsequent work on the Property will be required for both development (i.e. to increase production on multiple veins) and exploration (i.e. make a more thorough evaluation of the mineral potential of the Property);

7. Limited trenching elsewhere on the Property, on an exploratory basis, has demonstrated potential to identify additional well mineralized, high grade, copper-bearing veins well beyond those veins currently known. More specifically, the Major Veins, within the Main Mineralized Trend, are interpreted to extend through the Angela tenures (which are largely covered under a blanket of eolian sand of highly variable thickness) to the southwest; and

8. Further exploration will be required to make a more adequate evaluation of the mineral potential available on the Property.

The Property is interpreted to have considerable potential to

2013-02-14 MWR SWVI Displays Economic Iron Content increase production on both existing drifts, as well as developing additional drifts for production. In addition, the Property is believed to have considerable potential for discovery of additional high grade copper mineralized veins through a program of systematic exploration of the Property.

A primary mandate of the Company is to increase production from the Property. Therefore, the Company plans to aggressively pursue further evaluation of the ore, coincident with work to identify opportunities to increase development of additional high grade mineralized copper veins.

SAMPLES

Note: Grab samples are selective by nature and are unlikely to represent average grades of the deposit.

Samples ALGADG-14 to 16 are representative samples from hand sorted piles from the active Veta Gruesa Center Drift. Sample ALGADG-14 was taken from the most recent muck pile prior to hand sorting for grade separation. Sample ALGADG-15 is a representative sample of "Direct Shipping Ore" (i.e. ore that can be shipped, with no additional processing, directly to the government owned ENAMI facility at Copiapo), while ALGADG-16 is a sample of low grade ore stockpiled for later processing.

Samples ALGADG 4-5, and 8 to 13 were taken from an area of recent exploration to expose and develop additional near surface mineralization, located approximately 500 m west-southwest of the Production Drift. Representative samples were recovered from shallow surface trenches excavated to expose copper-bearing veins identified at surface along the projection of the vein.

Samples ALGA12RW-01-2 and ALGADG1-3 were taken from shallow, near surface trenches to test for copper-bearing mineralized veins in the immediate vicinity of an old, sand filled shaft discovered in the eolian sand cover. These exploratory trenches were excavated approximately 6.3 km southwest of the Veta Gruesa Centre Drift and approximately 1.3 km from a mapped exposure of the Jurassic Pluton Sierra El Roble, which hosts for the "Major Veins" documented to the north.

The remaining samples were taken from along a road cut which exposed dioritic material correlated to the Pluton Sierra El Roble, approximately 1.2 km east-southeast of the samples above and approximately 6.3 km southwest of the Veta Gruesa Centre Drift.

Our New Pick is SWVI

Hi Everyone,

SWVI is starting to jump back in gains and could reach its previous high of \$1 much faster than everyone thinks. It is clear to us that astute investors are scooping up cheap shares for a move much higher.

What could spark all the recent buying activity that we've witnessed?

Here are some of the main factors why shares in SWVI are getting scooped up:

#1- Many analysts reports stating that **SWVI'** shares to be **worth over \$7.**

#2- A recent press release from the Company stating that its property could be worth \$5.7 billion USD.

#3- Short-sellers that thought SWVI could go much lower and shorted shares in the low 20 cents area last week are now scrambling for shares to cover their positions.

#4- Some might have forgot but leading engineering firm AMEC could soon release a report on the potential value of the Algarrobo property.

We believe that members should see all 3 as clear catalysts as to why shares in **SWVI could soon soar 400% again.**

Let us elaborate on #4 above and why this could be significant for the Company.

AMEC is a leading engineering firm that has done work for major mining exploration companies like: GoldCorp, Barrick Gold, Rio Tinto, and Freeport McMoran. They've helped assess, report and uncover tremendous amount of gold, copper and other minerals in the past for Fortune 500 companies.

If we could compare AMEC to another agency it would be comparing them to the FDA (U.S. Food and Administration). Some biotech companies upon FDA approval soars hundred of percent. The same could soon happen with AMEC who will be assessing the property.

What do you think will happen if AMEC releases a report stating that the Algarrobo property could be worth billions of dollars Such a report could definitely **send SWVI berserk to over \$3 in our opinion.**

As stated by the company:

AMEC will produce a qualitative statement regarding the mineral potential of the Algarrobo Property in the shape of a Due-Diligence report. The report will be based on the information that Swingplane makes available to AMEC and a visit to the Property.

You can read the previous press release with AMEC from SwingPlane Ventures Inc.:
<http://finance.yahoo.com/news/swingplane-ventures-engages-amec-independent-224641626.html>

As we all know, the company also recently stated: "We believe that the **economic values of the Algarrobo are also comparable** if not greater from sampling tested demonstrating higher copper content than the Mantoverde district. (**worth \$5.7 billion USD**)

In our opinion, this statement shows how confident the company is in their Algarrobo property and is in line with their intention to have a top notch firm like AMEC confirm the value of their property. This report which is expected in the coming weeks could send shares soaring.

In the meanwhile, we expect shares to continue to rally in expectations of more positive announcements and the upcoming AMEC report. All signs seem to be pointing upwards and we are excited as ever to see what happens to SWVI in the weeks to come.

Viewers should always consult with a licensed securities professional before purchasing or selling any securities of companies profiled or discussed in our releases. It is possible that a viewer's entire investment may be lost or impaired due to the speculative nature of the companies profiled. Remember, never invest in any security of a company profiled or discussed in a release or on our website unless you can afford to lose your entire investment. Also, investing in micro-cap securities is highly speculative and carries an extremely high degree of risk.

Notice of Compensation

Please be advised that this website's receives compensation to perform promotional and advertising services for companies mentioned on our website, social media platforms, & our emails by third parties. This website's and or its affiliates have NOT received any compensation to date for investor communications services but expects to receive 10,000 Euro from a third party non affiliate for two months of coverage. This website's receives compensation as a production budget for advertising efforts and will retain amounts over and above the cost of production, copy writing services, mailing and other distribution expenses as a fee for our services.

Notice of Stock Price Movements and Volatility

Viewers of this newsletter should understand that trading activity and stock prices in many if not all cases tend to increase during the advertisement campaigns of the profiled companies and in many if not all cases tend to decrease thereafter. This tends to create above average volatility and price movements in the profiled company during the advertisement campaign that viewers should take into consideration at all times. Campaigns vary in length, and many are for short periods of time, typically less than a week.

Notice of Affiliated and Non-Affiliated Newsletters

This website's regularly shares research with other affiliated newsletter. Never invest in any stock featured on our site or emails unless you can afford to lose your entire investment.

Because we receive monetary or securities compensation, most often in the form of common stock (hereafter referred to as the "Shares") for our dissemination of publicly disseminated information (the "Information") regarding various issuers of securities, we disclose our specific compensation herein and in our individual reports of profiled issuers.

Our New Pick is SWVI

Hi Everyone,

We would like to begin this newsletter with a confession. Some of you may have noticed that when a pick drops in price, our confidence sometimes gets shaken. Since we pride ourselves on bringing you the best picks available, a drop in trading price can be quite discouraging. That being said, we want you to know that our confidence in **SWVI** has never been stronger!

When we initially alerted our members about **SWVI**, it was trading for less than 20 cents. At the time, we didn't have much to go on aside from a hunch and very little news about the activity of **SWVI**. Based on that hunch alone, most of you made up to **300% gains** with **SWVI**. But now our hunch is stronger than ever, and this time, we have the facts.

Over the course of the last month, **SWVI** has had some extremely promising results in terms of the analysis of their samples, and we have seen at least 3 analysts predict trading prices of over 7\$ for **SWVI**.

Furthermore, the current trading price of 30 cents is **STILL** higher than the initial trading price. In other words, most of our members who were with us from the start are making profit and are ready for more!

In order to strengthen your confidence in **SWVI**, consider the following. Over the years we have brought you several picks from the mining industry that have seen **gains of over 1,000%**.

Mining companies have had a history of doing great things to our members' investments. **SWVI** nearly quadrupled your investment and we believe it will do so again effortlessly.

We are currently waiting on AMEC's report to confirm what we already believe: **SWVI** may have dipped down for a brief moment but the best is yet to come!

The few members who did not invest in **SWVI** the first time we announced it missed out on **300% gains**. Second chances don't come around often, but here is your chance to jump on board a proven money-maker for our members at a very low price!
